

PORTABLE NAIL POLISH REMOVER

Technical Field

This invention relates to a nail polish remover, and more specifically relates to a
5 portable nail polish remover to be used, treated and keep easily.

Background Art

Generally, a nail polish is removed by having rag, cotton or tissue paper sucked in
a remover solution containing the composition of acetone.

10 Therefore, according to the prior art, there has been an inconvenience in that a
user has to repeat a motion for saturating a cotton-tip of a swab with the remover solution
whenever removing the nail polish. That is, while the user removes the nail polish using
the cotton-tip of the swab saturated with the remover solution, if the remover solution is
evaporated from the cotton-tip of the swab, the user opens again the cap of the remover
15 solution accommodating bottle to saturate the cotton-tip of the swab with the remover
solution, and then closes again the cap.

Further, there has been a problem that, since the remover solution accommodating
bottle and the swabs have to be keep individually, the keeping and management for them is
troublesome.

20

Disclosure of Invention

In view of the foregoing, it is an object of the invention to provide a nail polish

remover adapted to be treated and used simply.

Further, another object of the invention is to provide a nail polish remover adapted to be kept and managed conveniently.

To accomplish the above objects, a nail polish remover according to the invention
5 comprises a remover body having an opening at an upper end thereof, a non-woven fabric accommodated within the remover body with wound to be exposed through the opening of the remover body, a remover solution receptacle built in the remover body so that an outlet of the remover solution receptacle is directed to the opening of the remover body, the remover solution receptacle providing the non-woven fabric with the remover solution, and
10 a head engaged with the opening of the remover body to open and close the remover solution receptacle, the head providing the non-woven fabric with the remover solution.

Preferably, the inside of the remover body is provided with a supplying roller supplying the opening of the remover body with the non-woven fabric and a withdrawing roller withdrawing the non-woven fabric come out of the supplying roller.

15 Preferably, the remover body is provided with a reverse rotation-preventing projection, and the withdrawing roller is provided with a reverse rotation-preventing lever for hanging on the reverse rotation-preventing projection.

Preferably, a side casing of the remover body is formed with a positioning hole, and the remover solution receptacle is formed with a positioning projection passing
20 through the positioning hole and projecting to the outside.

Preferably, the head engaged with the remover body is integrally formed with a cap for opening and covering the outlet of the remover solution receptacle, and the inclined

portion of the head is formed with a plurality of discharging hole for discharging the remover solution supplied from the remover solution receptacle

Preferably, the lower end of the remover body is formed with a support for erecting the remover body.

5 Preferably, the opening of the remover body is provided with a head cap for covering the head.

Brief Description of Drawings

The above and other objects, features and advantages of the invention will be
10 apparent from the following detailed description of the preferred embodiments of the invention in conjunction with the accompanying drawings, in which:

Fig. 1 is a perspective view of a portable nail polish remover according to the invention;

15 Fig. 2 is a section view of a portable nail polish remover according to the invention; and

Figs. 3 and 4 are views for showing the operation of a portable nail polish remover according to the invention, wherein Fig. 3 is a section view for showing the status that a remover solution is not supplied, and Fig. 4 is a section view for showing the status that a
20 remover solution is supplied.

Best Mode for Carrying Out the Invention

Referring to Figs. 1 and 2, the nail polish remover comprises a remover body 10 including an upper casing and a lower casing. The remover body 10 is formed with an opening 11 at its upper end. Further, the remover body 10 is integrally formed with supports 12 disposed with an isosceles square shape at its lower end.

5 A remover solution receptacle 20 receiving a remover solution is installed within the remover body 10. The remover body 10 is provided with a supplying roller 41 supplying a non-woven fabric 41 and a withdrawing roller 42 withdrawing the non-woven fabric 40 at its lower side. A head 30 is engaged with the opening 11 of the remover body 10, and a head cap 50 covers the upper part of the head 30.

10 The remover body 10 is formed to being curved in one side direction with having a width narrowing more and more from the lower part to the upper part so that the opening 11 formed at the upper end of the remover body 10 is formed in the inclined status enough to supply the remover solution with the remover body 10 erected.

The remover solution receptacle 20 is erected so that an outlet 21 of the remover
15 solution receptacle 20 corresponds to the opening 11 of the remover body 10.

The head 30 is integrally formed with a cap 31 for opening and covering the outlet 21 of the remover solution receptacle 20, and an inclined portion 32 of the head 30 is formed with a plurality of discharging hole 33 for discharging the remover solution.

The non-woven fabric 40 come out of the supplying roller 41 is passed through the
20 opening 11, and then is winded on a outer surface of the head 30. Then, the non-woven fabric 40 is withdrawn to a withdrawing roller 42 via the opening 11 again.

One casing of the remover body 10 is provided with a reverse rotation-preventing

projection 13 for preventing the non-woven fabric 40 come out of the supplying roller 41 from being rotated reversely against the rotating direction winded to the withdrawing roller 42 so that the reverse rotation-preventing projection 13 is formed on the portion corresponding with the withdrawing roller 42. The withdrawing roller 42 is provided with
5 a reverse rotation-preventing lever 43 for hanging on the reverse rotation-preventing projection 13.

Further, the other side casing of the remover body 10 is formed with a positioning hole 14. The remover solution receptacle 20 is formed with a positioning projection 22 passing through the positioning hole 14.

10 The operation of the above portable nail polish remover according to the invention will be given herein below.

Referring to Fig. 2, if the supplying roller 41 is rotated clockwise, the withdrawing roller 42 engaged with the supplying roller 41 is rotated counterclockwise.

Then, the non-woven fabric 40 winded on the supplying roller 41 is unwound, and
15 then the non-woven fabric 40 contacted on the inclined portion 32 of the head is moved forwardly to be winded on the withdrawing roller 42.

At this time, since the withdrawing roller 42 is rotated only counterclockwise by the reverse rotation-preventing projection 13 constraining the reverse rotation-preventing lever 43, the reverse rotation of the supplying roller 41 and the withdrawing roller 42 is
20 prevented.

Referring to Fig. 3, the positioning projection 22 of the remover solution receptacle 20 is moved from the positioning hole 14 to the head 30. Further, the cap 31 of

the head 30 covers the outlet 21 of the remover solution receptacle 20.

At the status shown in Fig. 4, the positioning projection 22 of the remover solution receptacle 20 is moved to the opponent side of the head 30, the outlet 21 of the remover solution receptacle 20 is open, and then the remover solution flows downwardly out of the
5 remover solution receptacle 20, and then soaks into the non-woven fabric 40 winded on the outer surface of the head 30 via the discharging holes 33 of the head 30.

After a predetermined amount of the remover solution is supplied to the non-woven fabric 40, a user erects the remover body 10, and then removes the nail polish. If the user wants to supply the non-woven fabric 40 with the more remover solution, the user
10 has the remover body 10 tilted slightly so that the remover solution is supplied to the non-woven fabric 40 from the remover solution receptacle 20 via the head 30.

Thus, the remover solution removes the nail polish with continuously supplied to the non-woven fabric 40 exposed to the opening 11 via the discharging hole 33 of the head
30.

15 After using the portable nail polish remover, the user may keep simply the nail polish remover within a handbag by covering the head 30 with the head cap 50 after closing the outlet 21 of the remover solution receptacle 20 by moving the positioning projection 22 to the opening 11.

From the foregoing, the portable nail polish remover according to the invention
20 simply supplies the non-woven fabric with the remover solution if necessary by having the remover solution receptacle and the non-woven fabric. Further, the non-woven fabric is supplied in the reel type according to the usage state. Therefore, there is an effect in that

the nail polish remover is treated and used simply.

Further, there is another effect in that, due to the portability that the remover solution receptacle and the non-woven fabric is built in the remover body, a user may keep and manage conveniently the nail polish remover within a handbag or in a predetermined
5 place.

The present disclosure relates to subject matter contained in priority Korean Patent Application No. 20-2002-25394, filed on August 26, 2002, the contents of which is herein expressly incorporated by reference in its entirety.
